The change between two slides *is the argument*

- Motion
- First pass
- Backoff
- The throw
- Fragments
- Order
- Swap

TWO MOTIONS, ONE RULE

Auto-animate glides the parts that persist. Fragments hand the reveal to the presenter.

The first pass is the smallest one that runs

Every line after this one arrives by morphing, never by replacing the block.

- Motion
- First pass
- Backoff
- The throw
- Fragments
- Order
- Swap

JAVASCRIPT

step 1 of 3

```
async function poll(url, times = 3) {
  for (let n = 0; n < times; n++) {
    const res = await fetch(url)
    if (res.ok) return await res.json()
  }
  return null
}
```

A code block is the one slide where the type itself is the artefact.

Two new lines slide everything below them down

The four lines above the gap do not move. Two lines are new, and the three under them travel.

- Motion
- First pass
- **Backoff**
- The throw
- Fragments
- Order
- Swap

JAVASCRIPT — step 2 of 3

```
async function poll(url, times = 3) {
  for (let n = 0; n < times; n++) {
    const res = await fetch(url)
    if (res.ok) return await res.json()
    // 250ms, 500ms, 1s: the server is told we are still here
    await wait(250 * 2 ** n)
  }
  return null
}
```

A diff is a movement, so a diff slide should move.

The block ends where the argument ends

Returning null was a shrug. Throwing is the sentence the caller can act on.

- Motion
- First pass
- Backoff
- **The throw**
- Fragments
- Order
- Swap

JAVASCRIPT — step 3 of 3

```
async function poll(url, times = 3) {
  for (let n = 0; n < times; n++) {
    const res = await fetch(url)
    if (res.ok) return await res.json()
    // 250ms, 500ms, 1s: the server is told we are still here
    await wait(250 * 2 ** n)
  }
  throw new Error('poll: never 200' + url)
}
```

One line out of nine carries the claim. The other eight hold still.

Three steps, and the presenter holds back two of them

One key press per step. The deck moves on when the steps run out.

- Motion
- First pass
- Backoff
- The throw
- Fragments
- Order
- Swap

Ask once, three times

The loop runs and the caller hears nothing. It is the smallest thing that works.

Exit test: three requests, no waiting

Wait between them

250 ms, then double it. The server is told we are still here.

Exit test: the log shows the gap

Fail out loud

The last throw names the URL, so the caller can stop guessing.

Exit test: no null ever leaves

HELD BACK ON PURPOSE

A reveal the audience drives is an argument they can interrupt.

Where the queue sits is the decision on this slide

Read it in this order: the work runs, then it is logged, then the retry lands.

- Motion
- First pass
- Backoff
- The throw
- Fragments
- Order
- Swap

The queue runs the work

0 human waits before the job runs

The job is done before anyone is told. The listener lands on the next step.

Key point: the work never waits on a human

The log writes the truth

1 line per attempt, gap included

One line per attempt, with the gap that was waited. Nothing is summarised.

Key point: the log is the evidence

The retry runs alone

3 tries, then a throw that names the URL

It is a separate job, so it can be paused without stopping the queue.

Key point: one blast radius per job

Order here is the claim, so the next slide changes the order.

Moving the retry to the front halves the blast radius

The two cards that swapped crossed the slide. The log never moved, so nothing happened to it.

- Motion
- First pass
- Backoff
- The throw
- Fragments
- Order
- Swap

The retry runs alone

3 tries, then a throw that names the URL

It is a separate job, so it can be paused without stopping the queue.

The log writes the truth

1 line per attempt, gap included

One line per attempt, with the gap that was waited. Nothing is summarised.

Key point: the log is the evidence

The queue runs the work

0 human waits before the job runs

The job is done before anyone is told. The listener lands on the next step.

Key point: the work never waits on a human

Content moves sideways; chrome does not. The card that stayed put is not animated at all.
